Criterion -A

Criterion A

Strand (i) — Explain and Justify the Need for a Solution

Creative App Design & Logic | Name: Date: 1/9/26

1. Plan Your Justification

(quick notes only — these four parts are the same ones you'll write up as ONE paragraph in Part 3)

CONTEXT

(background on your topic — what's normal, common, or already true right now, before your specific problem comes in. You can frame this using the unit's concepts (Development, Evaluation, Adaptation) if it helps.)

MYP students have to manage homework, assignments, projects and revision tasks from several different subjects at the same time. These tasks often have different deadlines and levels of importance, which means students need to stay organised and manage their time effectively.

TARGET AUDIENCE

(who exactly is affected (age/group) + why this group, specifically. Naming a precise audience strengthens your answer, even though MYP 3 doesn't require one to be formally "specified.")

The main target audience for our solution is **MYP students**, especially students who have to manage homework from several subjects at the same time. They need to keep track of work from different teachers, subjects and deadlines throughout the school week.

PROBLEM

(the specific problem + why it happens (cause) + at least one fact based on your observation)

Homework can be given through different platforms, during lessons or through announcements. This means that information about assignments and deadlines may be spread across different places instead of being organised in one clear system.

Because of this, students may forget assignments, miss deadlines or feel overwhelmed when they have several tasks to complete. It can also be difficult for students to decide which task they should complete first, especially when multiple assignments are due around the same time.

THE NEED - Secondary evidences

(what happens if it's not solved (impact) + why a solution matters, backed by evidence)

Digital scheduling and task-management tools can help users organise information, deadlines and tasks in one place. Research into these types of tools shows that the way information is organised and presented can affect how easily users are able to plan and manage their tasks.

This shows that having homework information in a clear and accessible format could help students stay organised. A centralized homework-management app could allow students to record homework from different subjects, view upcoming deadlines, prioritise important tasks and keep track of completed work.

Therefore, a solution is needed to make managing homework simpler and less overwhelming for students.

3. Write Your Justification

(now turn your notes into ONE connected paragraph — don't just answer the four parts separately. Include at least one piece of evidence and say where it came from.)

Use these linking phrases to connect your ideas:

To start	*"[Group of people] often experience..."*
To explain cause	*"This happens because..."*
To add evidence	*"For example... / According to [source]..." — "This shows that..."*
To finish	*"Therefore, a solution is needed because..."*

DESIGN PROBLEM — WORKED EXAMPLE

Context + Target Audience + Problem (with evidence) + The Need

Many students at our school carry multiple bags and personal items between classes every day, often in busy corridors or crowded lockers. Grade 8 and 9 students in particular are affected, especially during the morning rush and the lunch period, when the library and cafeteria are at their busiest and belongings are most likely to be set down and forgotten. This has led to a growing lost-and-found problem: items like water bottles, pouches, and stationery are frequently left behind and rarely find their way back to their owner. This happens mainly because there is no quick way for a student to report a lost item or check if it's been found. In a short survey of 30 students in Grades 8–9, 22 said they had lost a personal item at school in the last month, and only 6 of those items were ever recovered. This matches a 2023 article on school lost-property systems, which found that most schools recover less than 40% of lost items when there's no digital way to log or search for them. As a result, students lose money replacing items and feel frustrated, sometimes losing things they can't easily replace. Therefore, a solution is needed that gives students a fast, simple way to report and search for lost items, reducing the time and money wasted on belongings that are often sitting just a few rooms away.

Justifying the Need for a Solution

(Context + Target Audience + Problem (with evidence) + The Need — write it as ONE paragraph below)

MYP students have to manage homework, assignments and projects from several different subjects, often with different deadlines. Our target audience is MYP students who need to keep track of work from multiple teachers throughout the week. However, homework can be given through different platforms and during lessons, making it difficult to keep everything organised in one place. This may cause students to forget tasks, miss deadlines or struggle to prioritise their work. Therefore, a solution is needed to make managing schoolwork easier and more organised. Our proposed solution is a homework-management app where students can keep track of tasks from different subjects, view deadlines and prioritise their work.

Criterion A: Inquiring and Analysing

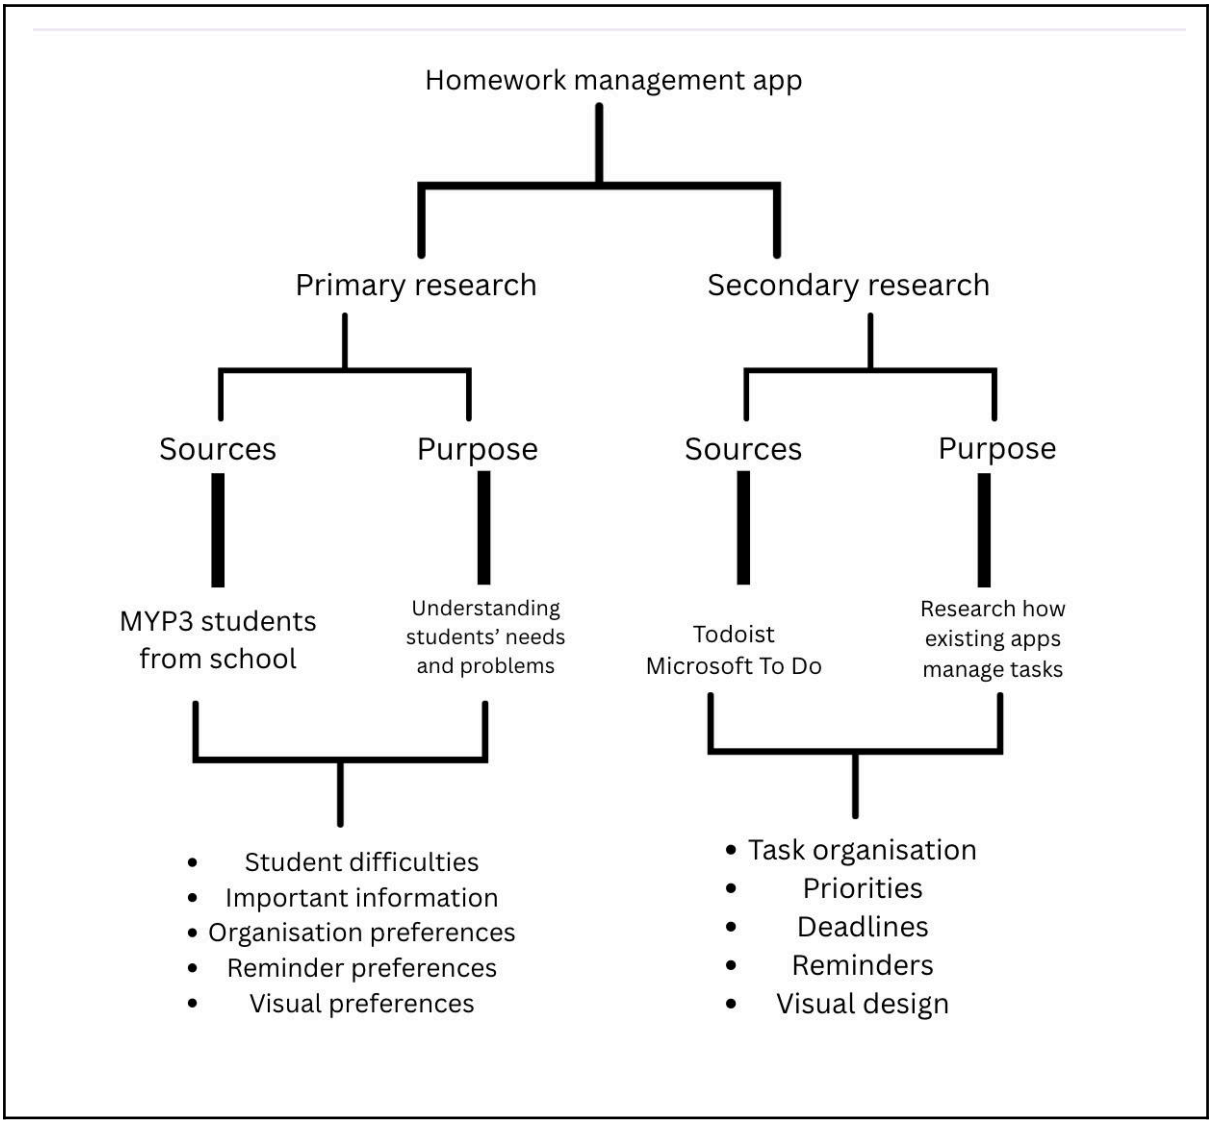

Strand ii — Construct a detailed research plan

One or two sentences on what you still need to find out, and how you have organised your research.

Before designing my homework-management app, I need to research both the needs of MYP students and the features and design approaches used in existing digital task-management platforms. I have organised my research into primary and secondary research and prioritised the questions according to how important they are for developing a useful solution. The highest priority questions focus on understanding the target users and the main problems they experience, and lower priority questions focus on additional features and visual aspects.

Research Plan

Show your plan as a mind map or flowchart. Split it into Primary and Secondary, then split each of those into Sources and Purpose.

Minimum five questions. Questions must be open — start with What, Which or How, never Is, Does or Can. Name the actual source and its appendix number. The last column says what you will do differently once you know the answer.

Question	Priority	Type	Source	Justification
Research area 1 — Student difficulties				
What difficulties do MYP3 students face when managing homework from different subjects?	**High 1**	Primary	MYP3 students from school	This is important because I need to understand the main problems students experience before designing the app. It will help me identify which problems my product needs to solve, so I will focus my design on the most common difficulties students mention.
What information do students need most when they have several homework tasks to complete?	**High 2**	Primary	MYP3 students from school	I need to know which information students find most useful when managing multiple tasks. This will help me decide what should be shown clearly on the main screen, such as deadlines, subjects or task priority.
Research area 2 — Organising tasks				
How should students organise homework from different subjects so that tasks are easy to find?	**High 3**	Primary	MYP3 students from school	I need to find out which organisation method would be easiest for the target users. This will help solve the problem of having tasks from many subjects in different places. I will use the students' preferred organisation method in my app.
How do existing task-management apps organise large numbers of tasks?	**Medium 1**	Secondary	Todoist	I need to understand how existing apps allow users to manage many tasks without becoming confused. This will give me ideas for organising homework efficiently, and I will adapt the most useful organisation features for students.
Research area 3 — Priorities and deadlines				
What methods do students use to decide which homework task they should complete first?	**Medium 2**	Primary	MYP3 students from school	I do not yet know how students decide which task is most important when they have multiple deadlines. This will help me decide whether my app needs priority levels or another way of ranking tasks.

What features do existing task-management apps use to help users manage deadlines and priorities?	**Medium 3**	Secondary	Microsoft To Do	I need to research how existing apps help users keep track of important and upcoming tasks. I will use useful features such as due dates, priority levels and planned tasks as inspiration for my design.
Research area 4 — Reminders				
What types of reminders would students find most useful for remembering homework deadlines?	**Low 1**	Primary	MYP3 students from school	I need to understand which reminders students would actually find helpful. This could prevent students from forgetting deadlines while avoiding unnecessary notifications. I will include the reminder system that best matches students' preferences.
How do existing task-management apps remind users about upcoming and overdue tasks?	**Low 2**	Secondary	Microsoft To Do	I need to investigate how existing apps notify users about deadlines. This will give me ideas for creating an effective reminder system, which I can adapt to suit students.
Research area 5 — Visual design and usability				
What visual layout would make it easiest for students to understand several homework tasks at once?	**Low 3**	Primary	MYP3 students from school	I need to know which layout students find easiest to understand because a complicated design could make managing homework more difficult. I will use the preferred layout when designing my app interface.

Replace [product] with your own product, and make each question sharper still. "What is the average size of a board game?" is better than "What size should it be?". Delete any rows you do not need and add your own.

Priority: rank within bands — High 1, High 2, High 3, then Medium 1, 2, 3, then Low 1, 2, 3. High priority questions are the ones you must answer before you can design anything. Low priority questions are useful, but the design would survive without them.

Criterion A: Inquiring and Analysing

Strand iii — Analyse a range of existing products that inspire a solution

---

Formula — how many products? 2 products for 3–4, 3–4 products for 5–6, 5 products for 7–8. Your checklist asks for a minimum of 6 coloured pictures — analysing 6 satisfies both.

Choose your method

Formula: is what you are analysing mostly digital, or mostly physical?

Method	Use it when	Best suited to
CPFC	Analysing an app, website or digital service	*Digital products — something with screens and a task to complete*
ACCESS FM	Analysing a manufactured physical product	*Physical products — furniture, packaging, devices, tools*
PPC	Understanding how a physical object is built	*Physical products where construction and mechanism matter most*
SWOT	Judging a product or brand's position in the market	*Either — useful alongside one of the three above, not instead of it*

You do not have to pick only one. Use CPFC or ACCESS FM or PPC as your main method for every product, then add a short SWOT if you want to judge its market position too.

Method 1 — CPFC

Use this for a digital product — an app, website or platform.

Formula: choose one task a real user would do on it, and analyse that journey — not the whole product.

C — Components

Formula: screenshot every screen on the task, in order, then label what is on each one.

P — Purposes

Formula: this component exists so that the user can ___.

F — Flow

Formula: from [screen] the user taps ___ to reach [screen]. It takes ___ steps in total.

Do not skip the hidden states. Deliberately break it — submit nothing, lose the connection, search for something that does not exist. Screenshot the empty state, the loading state and the error state. These are components too.

C — Complexities

Formula: this breaks down when ___, because ___.

Screen	Component and purpose	Flow — what happens next	Complexity noticed
Menu screen	*Search field — lets the user find a dish without scrolling*	*Tap a dish card to open Dish detail*	*No results shown if the search finds nothing*

Method 2 — ACCESS FM

Use this for a manufactured physical product.

Formula, one row per aspect: [Aspect] — strength: ___ — weakness: ___.

Aspect	Strength	Weakness
Aesthetics		
Cost		
Customer		
Environment		
Size		
Safety		
Function		
Materials		

Every aspect needs both a strength and a weakness. If you cannot find a weakness, look harder — no product scores perfectly on every aspect.

Method 3 — PPC

Use this to understand how a physical object is built, not just how it looks.

Formula: place an image of the product in the centre of the page, then work outward in three passes.

P — Parts *Formula: label each part with its correct name, or a name that describes it.*	**P — Purpose** *Formula: this part exists so that ___.*	**C — Complexities** *Formula: [part A] and [part B] work together to ___. This creates a weakness because ___.*

Method 4 — SWOT

Use this alongside one of the three methods above, to judge market position.

Formula, one sentence per box: this product's [strength/weakness/opportunity/threat] is ___, because ___.

Strengths	Weaknesses
Opportunities	**Threats**

SWOT alone is not enough for this strand. It tells you the product's position, not how it works. Pair it with CPFC, ACCESS FM or PPC — never submit SWOT on its own.

Repeat your chosen method for every product. Use the same method for all of them so they can be compared. Aim for 6 products in total.

Conclusion, per product

Formula: from this product I will carry forward ___, and I will avoid ___.

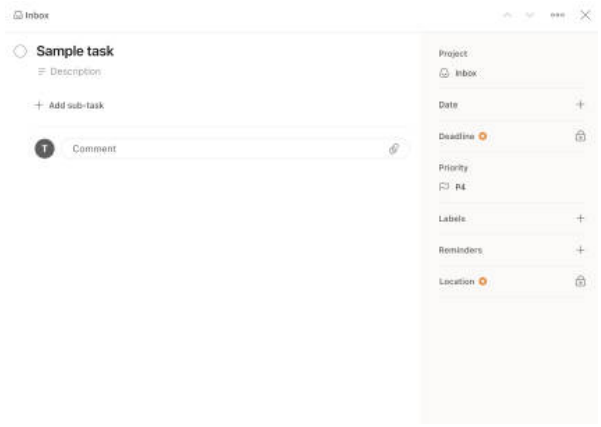

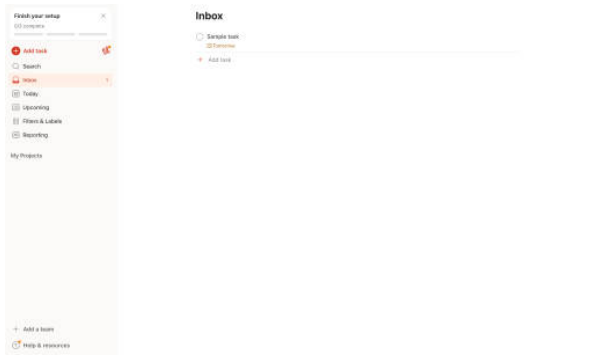

Very important. All pictures, text or anyone else's work must be cited.

MY WORK:

Goal: Add a task and the deadline, and be able to view and edit it clearly.

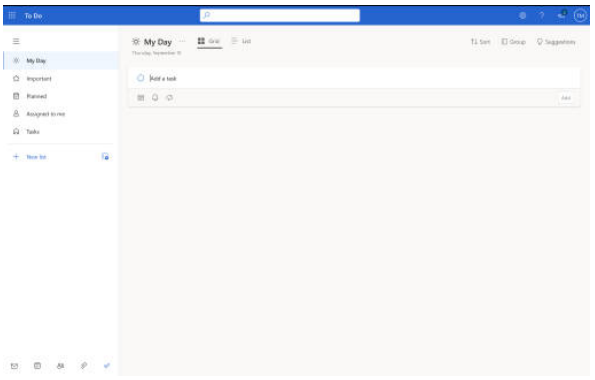

Website 1: Todoist

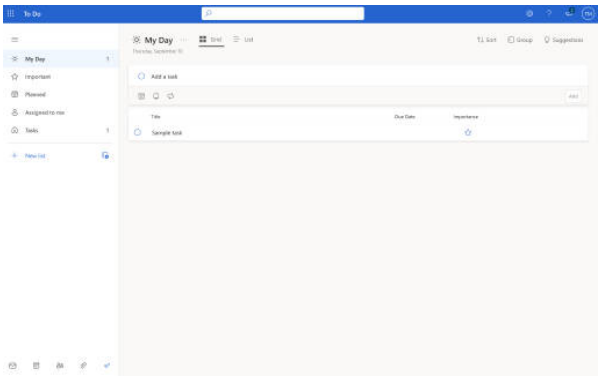

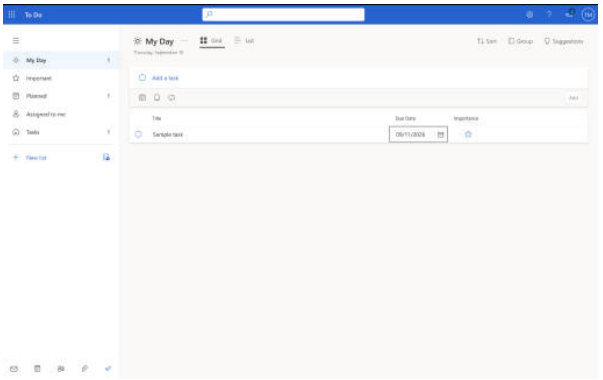

Screen	Components and purpose	Flow - what happens next?	Complexity noticed
	This is the initial home page. It has a clear bar on the left side, allowing people to easily add tasks, or find previous ones, with labels as well.	Next, you can add your task by pressing "Add Task"	The reporting column is kind of confusing, and has too many complex directions.
	This is the page after I added the sample task. It is the inbox, to show all upcoming tasks.	Next, you can set a deadline for it in the calendar	It can be hard to manage the inbox column when all the tasks are packed together in one page, with no gaps.

	This is after I clicked on the task, where I can see all the information about this task, and edit everything.	Next, you should select the details.	No complexities.
	This is the final screen, after adding the due date.	--	No complexities.

Conclusion: From this product I will carry forward the clear task-editing system, and I will avoid overcrowding the task list with too much information.

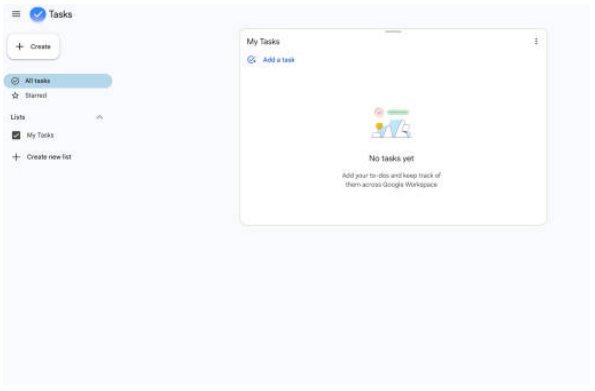

Website 2: Microsoft to do

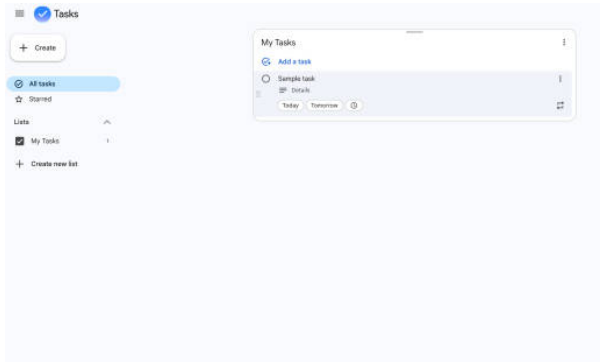

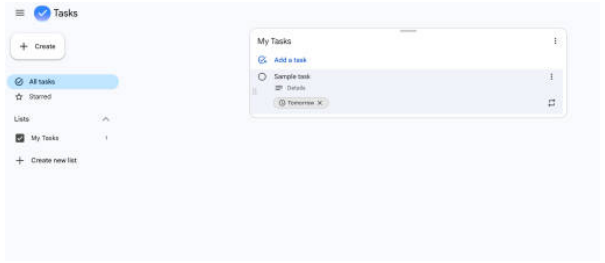

Screen	Components and purpose	Flow - what happens next?	Complexities noticed
	This is the home page. There is a side panel with all the different sections to the website.	Add a task by typing it into the bar.	There are two panels, one at the left side, and one on the bottom with just symbols, which might be confusing to remember.

	After adding a task, this is how the screen will look.	Next, you can add the deadline by clicking the “due date” box and typing it in.	“My Day” and “Tasks” both show one to do task, which could be counted as a double, even though its the same task, just shown in two different panels.
	After adding the due date, this is how it will look. Task name and due date are both marked clearly.	Next, you can mark whether it is important or not, which is a useful side option.	No complexities

Conclusion: From this product I will carry forward the clear display of task information and the option to mark tasks as important, and I will avoid having the same task appear duplicated across different sections.

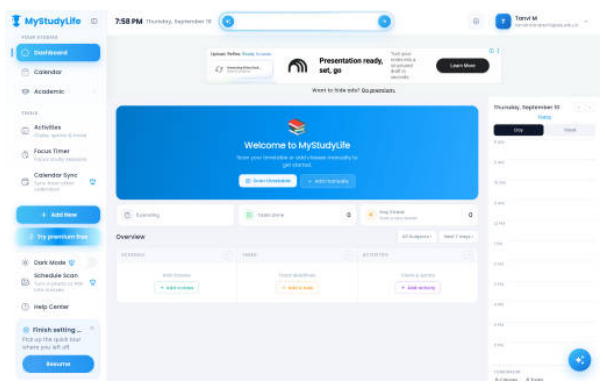

Website 3: Google tasks

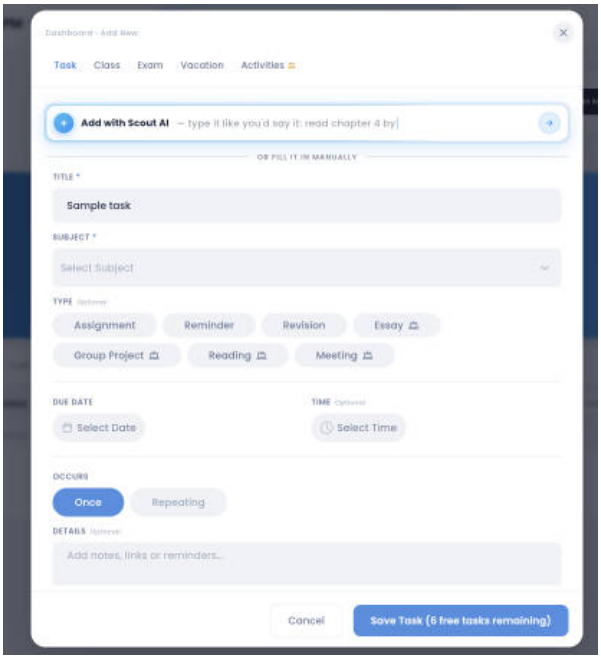

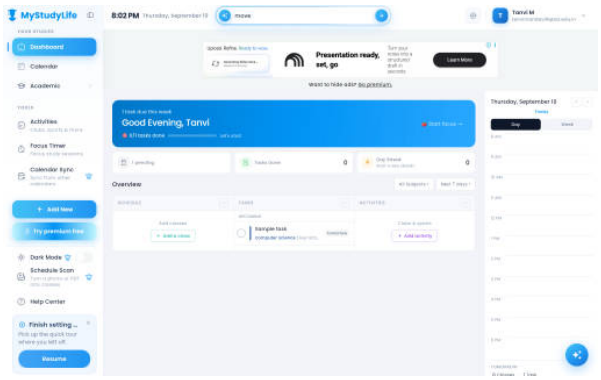

Screen	Components and purpose	Flow - what happens next?	Complexities noticed
	This is the home page. It has an option to add tasks, and a place to see all tasks and starred.	Add a task by typing it in.	No complexities, very simple page.

	This is after I added a task, and named it.	Add the deadline, by pressing “tomorrow” (convenient for close deadlines to set easily)	After pressing add a task, the page automatically opens up details, deadlines, and notes, which may be slightly overwhelming at first.
	This is after I selected “tomorrow” as the deadline.	--	No complexities

Conclusion: From this product I will carry forward the simple and clearly organised interface and convenient deadline options, and I will avoid automatically displaying too many additional options when creating a basic task.

Website 4: MyStudyLife

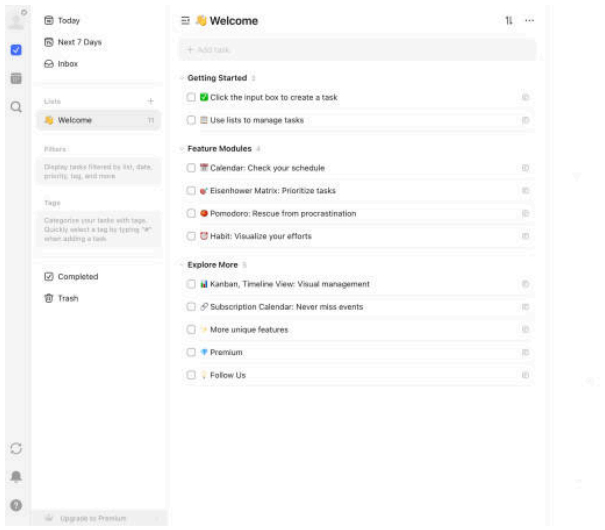

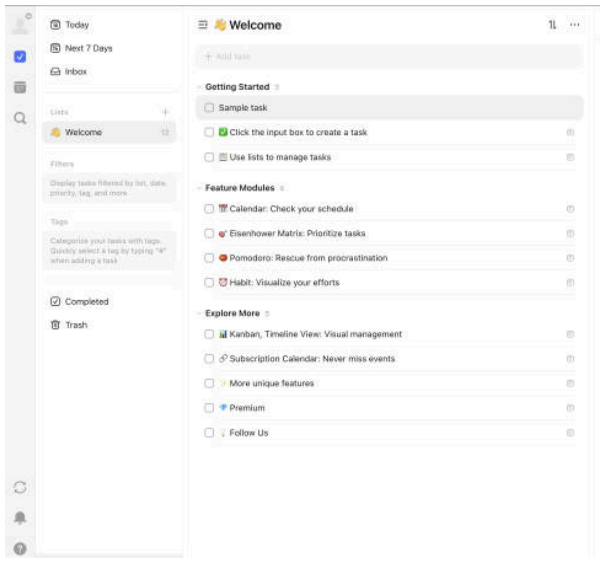

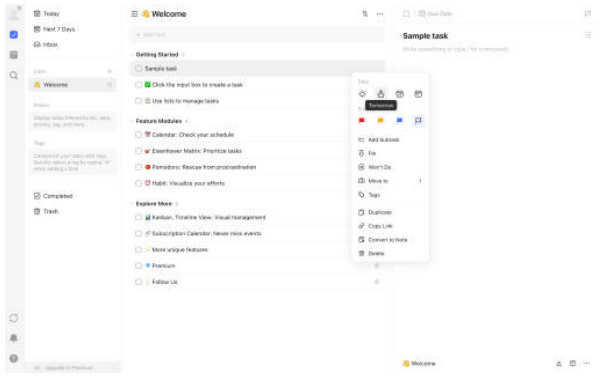

Screen	Components and purpose	Flow - what happens next?	Complexities noticed
	This is the home page. It has multiple panels, sections, and options to add task	Click on “add new” to create a new task	The page is extremely complex, and has way too many things to go through. It is difficult to understand and takes time to navigate.

	After clicking “add new”, it opens up this pop-up, where you can enter the task name.	Fill in all the details.	There are multiple different details to fill in, which could end up being confusing, and choosing a subject is mandatory for every task. Additionally, all the subjects are non-deletable, resulting in too many extra subjects if you don’t require them.
	This is after I selected the deadline and compulsory subject.	--	Since the columns are so small, the full task name isn’t visible, resulting in confusion between similarly names tasks.

Conclusion: From this product I will carry forward the ability to organise tasks according to subjects, and I will avoid making too many details compulsory or overcrowding the interface with unnecessary sections.

Website 5: TickTick

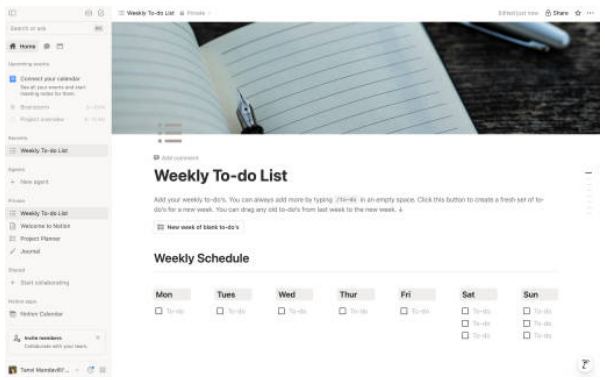

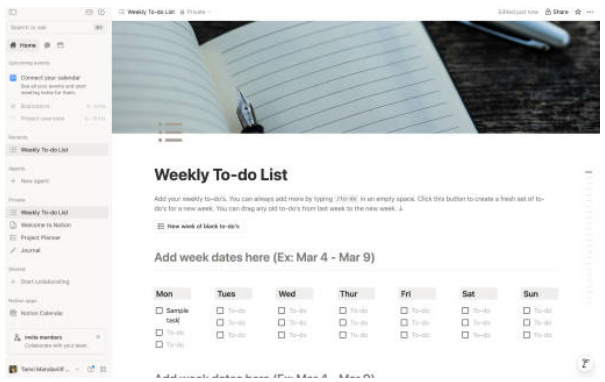

Screen	Components and purpose	Flow - what happens next?	Complexities noticed

	This is the home page. There are lists, filters, and tags on the home page.	Add a task using the bar at the top of the page.	There are many lists already on the page, prior to me creating any, cluttering up the space.
	This is what you can see after adding a task.	Add a deadline for the task by pressing the calendar icon next to the task name.	The task which you create gets buried under the already existing lists, which are unnecessary.
	This is what you will see after pressing the calendar icon, and there are options to fill in further details.	Select a deadline and fill in other required information.	The options to select a deadline and very unclear, showing unfamiliar symbols instead of clearly saying “today” or “tomorrow”

	This is the page after adding a deadline. You can clearly see the due date next to the task name, on the right side.	--	No complexities.

Conclusion: From this product I will carry forward the clear display of deadlines next to tasks, and I will avoid unnecessary lists and unclear symbols that could make navigation more difficult.

Website 6: Notion

Screen	Components and purpose	Flow - what happens next?	Complexities noticed
	This is the home page. There are panels on the left, and a useful weekly planner at the bottom.	Add a task by entering it in the to do list.	I was unable to find a way to add a general task outside of the weekly to-do list, so it did not fully satisfy the requirements of my intended homework-management system.
	After adding the task, here is how the page looks.	--	I also could not find an option to add a due date or deadline, making it less relevant for my intended solution.

Conclusion: From this product I will carry forward the weekly planning concept, and I will avoid limiting tasks to a specific type of list or making important features such as deadlines difficult to find.

Criterion A: Inquiring and Analysing

Strand iv — Develop a detailed design brief

Write your design brief here.

- Connect the research from strand i — the problem and your target audience.
- Connect the research from strand ii — what your primary and secondary research found.
- Connect the research from strand iii — what the existing products taught you.
- Cite every piece of research you refer to.
- State what you are going to design and make.
- Say who it is for, and why.

Secondary Research Brief

My secondary research focused on how existing task-management apps organise tasks, manage priorities and deadlines, and remind users about upcoming work. I found that useful task-management systems should make important information such as the task name, subject, deadline and priority easy to see. I also found that reminders and simple organisation can help users keep track of multiple tasks without making the interface too complicated.

Secondary Research Sources Used:

https://app.notion.com/p/Weekly-To-do-List-d138ac6a94744a409f15c74cd8e973e4

https://ticktick.com/webapp/#p/inbox/tasks

https://web.mystudylife.com/#/home/dashboard

https://tasks.google.com/tasks/

https://to-do.live.com/tasks/today

https://app.todoist.com/app/inbox

Primary Research Brief

I interviewed some of my MYP3 section mates to understand the difficulties they face when managing homework from different subjects. I focused on what information they find important, how they prefer to organise tasks, what types of reminders they would find useful, and what visual layouts are easiest to understand. This helped me understand the needs and preferences of my target users, which I can use when designing my app.

Brief of Market Research

I analysed six existing digital products: Todoist, Microsoft To Do, Google Tasks, MyStudyLife, TickTick and Notion. I found that features such as clear task information, visible deadlines, subject organisation and simple task editing can be useful. However, some products had problems such as overcrowded screens, too many sections or lists, unclear symbols, and important features being difficult to find. These products gave me ideas for features I could include while also showing me what I should avoid.

Important Insights and Patterns Identified

Summary of Research Brief

From my primary, secondary and market research, I identified these important requirements:

- Tasks should clearly show important information such as the task name, subject and deadline.
- Homework should be organised by subject or another simple system so that tasks are easy to find.
- Important or urgent tasks should be easy to identify and prioritise.
- Reminders should be useful without creating unnecessary notifications.
- The interface should be simple and easy to understand.
- The app should avoid overcrowding the screen with too many sections, symbols or unnecessary information.
- Deadlines and other important features should be easy to find and edit.

Product Brief

My final product will be a homework-management app designed for MYP3 students from my school. The app will allow students to add, view and edit homework tasks, organise them by subject, set deadlines and priorities, and receive useful reminders. The interface will have a simple and clear layout so students can quickly understand what work they need to complete. The design will avoid unnecessary features and overcrowding, while making important information such as deadlines and priorities easy to see.

Example — from a real portfolio

Strand iv — Develop a detailed design brief

Secondary Research Brief

Every serving of Snacktive must present an optimal balance of macronutrients and indispensable micronutrients to answer the nutritional demand of children 10–14 years old. Preferably, it must carry 10–15g protein, 6–8g of fiber, and 4–6 mg iron to enhance muscle development, promote digestive regularity, and assure proper delivery of oxygen by the body.

To preserve nutrition with minimum fat consumption, the most appropriate cooking techniques would be baking, air-drying, or roasting since deep-frying incorporates excess fats and boiling can destroy water-soluble vitamins.

Primary Research Brief

For Indian children between the ages of 10–14, the best macronutrient composition should be about 50–55% carbohydrates, 20–25% protein, and 20–25% good fats for growth and energy requirements. For better iron absorption of black beans and spinach, complementing them with vitamin C-containing foods such as citrus fruits or bell peppers works well.

Brief of Market Research (existing products)

The Indian health food market is growing day by day, but nevertheless, there remains a large sector that has been left untapped — the savoury health snack market. That leaves only 1 player in the savoury healthy snack space, Snackible, which is able to attract a great deal of attention through innovative flavours and combinations but still fails in exciting the average adolescent consumer.

Important Insights and Patterns Identified (Summary of Research Brief)

Both forms of research conducted highlight the importance of:

- *A balanced ratio of carbohydrates, proteins, and fats to ensure sustained energy and support growth in the target age group.*
- *Vitamin C in aiding iron absorption from ingredients like black beans and spinach.*
- *Baking or Air-Frying while cooking the product to reduce fat quantity and preserve nutrients.*
- *Reducing the amount of Anti-Nutrients like phytates and oxalates by soaking, fermenting or sprouting millets and spinach.*
- *Using natural flavorings in the seasoning blends to minimize the introduction of unwanted chemicals.*
- *Legumes, whole grains, seeds and black beans in maximising the amount of protein and fibre in the snack.*

Product Brief

Snacking is the favourite pastime of the human population, something every single person engages in, and an opportunity to provide much-needed nutrition that hasn't been exploited as yet. The ideal delivery mechanism of these benchmarks would be a simple snack — something that can be eaten at any time of the day, at work or at home, during commutes as well.

This can very easily be done by creating a snacking solution with the following benchmarks and features:

Nutrition

- *Macronutrient Ratio: ~50–55% carbohydrates, 20–25% protein, 20–25% healthy fats*
- *High in Protein: 10–15g per serving*
- *Rich in Fiber: 6–8g per serving*
- *Low in Calories: 250–350 kcal per serving*

Key Features

- *Base Ingredients: Millets (ragi, bajra), chickpeas, lentils, black beans, oats, quinoa*
- *Savory Flavors: BBQ, garlic parmesan, masala, chaat*
- *No Artificial Preservatives or Additives*

It is essential that the product features a bright colour scheme, differentiating itself from the other snacks found in regular supermarkets in order to captivate the attention of the target audience. To further hone in the solution's ability to cater to the target group, it must be available in four different flavours, each attracting a different sector of the group.

Shortened for length. This example shows secondary research, primary research, market research, a summary of insights, and the product brief — all connected to one another, and every claim traceable back to a finding above it.

Criterion -B

Criterion B: Developing Ideas

Strand i — Develop design specifications which clearly state the success criteria for the design of a solution

---

State which format you are using in one line before the table — ACCESS FM, adapted to your product. Drop headings that do not apply to your product; add ones that do.

Design Specification

For each aspect: say what the product shall do, with a number or a measurable outcome. Justify it from a specific piece of research — the survey, the interview, the product you analysed. Name how you will test that it was met. A criterion with no research behind it is a preference, not a specification.

Aspect *ACCESS FM, adapted to your product.*	**Design specification** *The product shall… — a number or a measurable outcome.*	**Justification — from my research** *Name the source: the survey, the interview, the product analysed.*	**Testing method** *How you will prove it was met. Use more than one kind.*
Content	Display at least 4 pieces of information for each task: task name, subject, deadline and priority.	My research plan asks what information students need most. In my product analysis, Todoist and Microsoft To Do showed task details and deadlines, while I identified that clear task information is useful.	Feature check: add sample tasks and check that all 4 details can be entered and viewed. User test: ask 3 MYP3 students to find those details.
Aesthetics	Use no more than 3 main colours, with consistent text and button styles across the main screens.	My research plan asks what visual layout students find easiest to understand. In my analysis, I noticed that crowded screens and too many sections could make apps harder to use.	Visual check: count the main colours and compare styles across screens. User test: ask 3 students whether the screens look consistent and clear.
Customer	Be designed for MYP3 students from my school, using homework and subject-based examples.	My target audience is MYP3 students from my school, and my primary research was planned around understanding their homework-management needs.	Content check: review the app's examples and labels. User test: ask 3 MYP3 students to try the prototype and say whether it suits their homework.
Cost	Be usable by students at ₹0, with no payment required to access the core task-management features.	This is a proposed accessibility requirement for the target audience, rather than a finding from my research.	Cost check: review the prototype's planned features and any required payment. Task test: confirm that users can access the core features without a payment step.
Size	Fit a screen that is 320 pixels wide without horizontal scrolling or text being cut off.	My research plan includes visual layout and usability. My product analysis also identified small columns and task names being difficult to see as a problem.	Screen test: view the prototype at 320 pixels wide. Visual check: confirm that text, buttons and task details are not cut off.
Functionality	Allow users to add, edit and delete a task, and set its subject, deadline, priority and reminder.	My research plan focuses on task organisation, priorities, deadlines and reminders. My analysis of Todoist and Microsoft To Do showed task editing and priority features, while other apps gave examples of deadline and reminder features.	Feature test: complete each action using sample tasks. User test: ask 3 students to add a task, change its deadline and set a reminder.
UX/UI	Let users add a task with its name, subject and deadline in no more than 4 steps.	My analysis found that Google Tasks was simple to use, while MyStudyLife had many sections and required details that could make task creation feel complicated.	Step count: record the number of steps needed. User test: ask 3 students to add a task without help and record whether they complete it within 4 steps.

Success Criteria Rubric

For each aspect, write your own descriptors at 1–2, 3–4, 5–6 and 7–8. Use the same measurable unit at every band — only the threshold changes. Set the 7–8 value first: what does excellent actually look like? Then work down in even steps.

Write this before you design, not after — so success is defined rather than decided afterwards.

Aspect	Met	Partially Met	Unmet
Content	All 4 required details (task name, subject, deadline and priority) are clearly shown for every task.	2–3 of the 4 required details are shown clearly.	0–1 of the 4 required details are shown.
Aesthetics	The app uses 3 or fewer main colours consistently across all main screens.	The app uses 4–5 main colours or has some inconsistent visual elements.	The app uses 6 or more main colours and/or has mostly inconsistent visual elements.
Customer	3/3 MYP3 students successfully complete the assigned task using the app.	1–2/3 MYP3 students successfully complete the assigned task.	0/3 MYP3 students successfully complete the assigned task.
Cost	The core features of the app are completely free to use (₹0).	Some core features require a payment of ₹1–₹100.	Core features require a payment of more than ₹100.
Size	The app works at a screen width of 320 px without horizontal scrolling or cut-off content.	The app works at a screen width of 400 px without major layout problems.	The app requires a screen width of 600 px or more to work correctly.
Functionality	All 6 required functions work correctly: adding, editing, deleting, organising, setting deadlines/priorities and reminders.	3–5 of the 6 required functions work correctly.	0–2 of the 6 required functions work correctly.
UX/UI	A task can be added with its name, subject and deadline in 4 or fewer steps, with no major confusion.	A task can be added in 5–7 steps, with some confusion.	A task requires 8 or more steps or cannot be added successfully.

Criterion B
Strand (ii) — Present a Range of Feasible Design Ideas

(Present = show a design idea in an appropriate medium so it can be interpreted by others. Annotate = label the idea's key features so someone else could understand it without you explaining it out loud.)

1. Plan Your Ideas

(quick notes only — turn these into sketches/mock-ups in Part 2)

IDEA SOURCE *(which part of your crit -B strand i specification is this idea trying to meet? Name the aspect(s).)*
MEDIUM *(how will you show it — hand-drawn sketch, digital wireframe, screen mock-up? Pick one you can annotate clearly.)*

Formula — how many ideas, and how much detail?

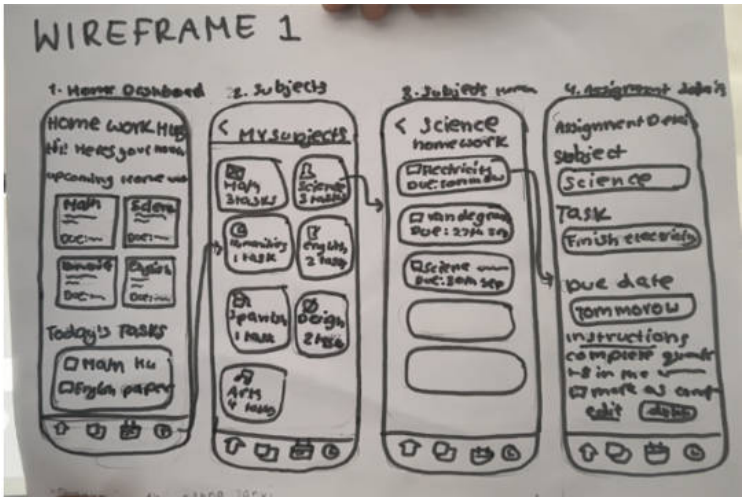

Band	Ideas	Detail required
1–2	1 idea	Just the idea itself, presented so it can be interpreted by others.
3–4	2–3 ideas	An appropriate medium (sketch/mock-up), OR key features explained in words — not both yet.
5–6	4 or more ideas — "a range"	An appropriate medium AND key features explained with annotation.
7–8	4 or more ideas — "a range"	An appropriate medium AND annotation — labels on the idea itself, not just a caption underneath.

This maps the official wording (one → a few → a range → a range, with 5–6 and 7–8 told apart by annotation, not count) onto real numbers — the same move Strand iii made turning "analyse a few products" into 2 / 3–4 / 5. Check it against the department checklist before treating it as fixed, and flag it to Dev if the checklist gives a different number.

2. Sketch Each Idea

(one box per idea — copy this box for as many ideas as your band needs)

Idea 1

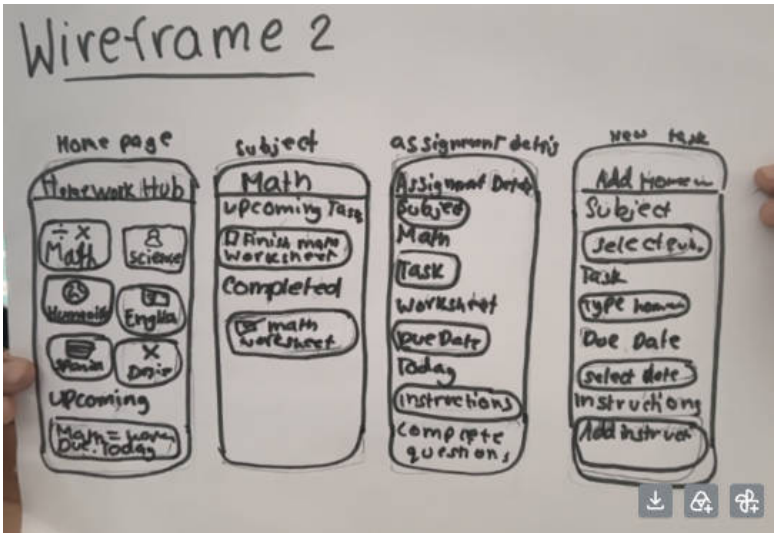

Annotate it: point to at least 2–3 features and say what each one does.

Justification Against Success Criteria :

This wireframe first shows the overall homework list. Next, you can select specific subjects to show all tasks in that subject, and clicking each task lets you see the details. This is a clear and simple way to differentiate each subject's tasks, while also showing individual task details.

Idea 2

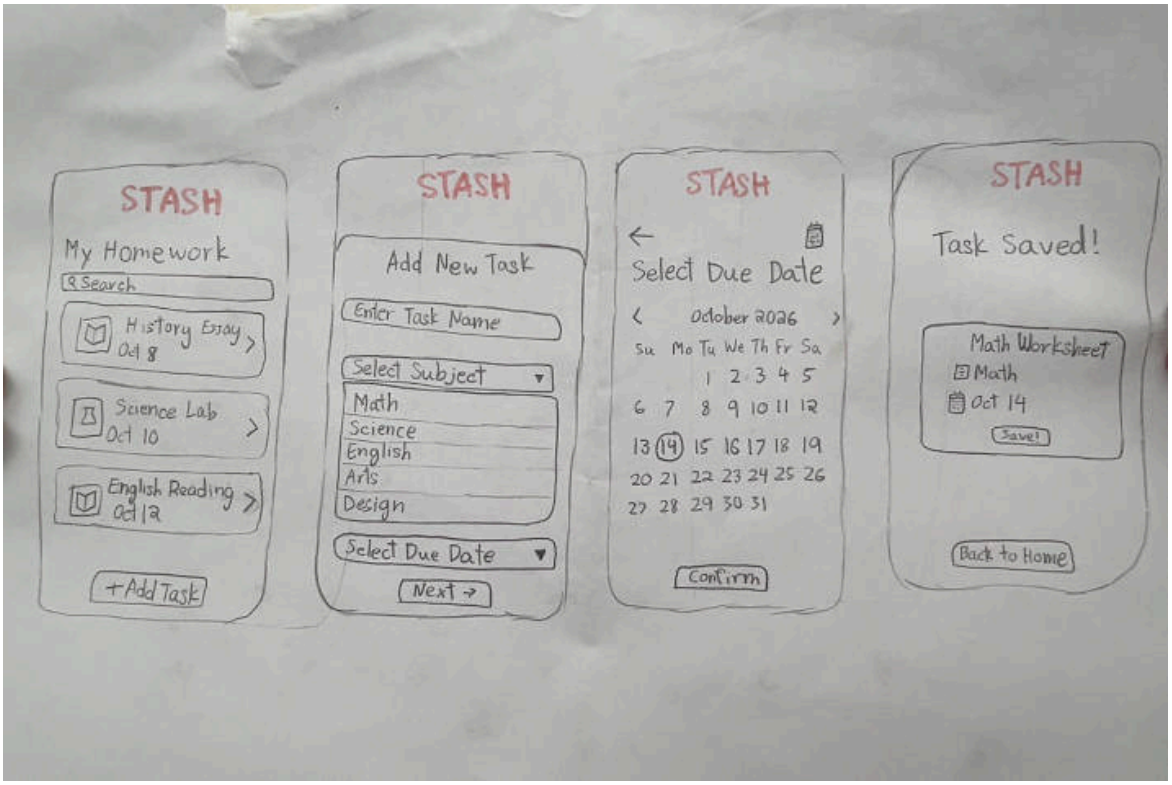

Justification Against Success Criteria :

The second one is titled homework hub, and the home page shows each subject separately, with small icons. Once you select a subject, it directly displays each task and its details. This makes the process of checking tasks extremely quick, with only 2 clicks required to view all tasks clearly.

Annotate it: point to at least 2–3 features and say what each one does.

Idea 3

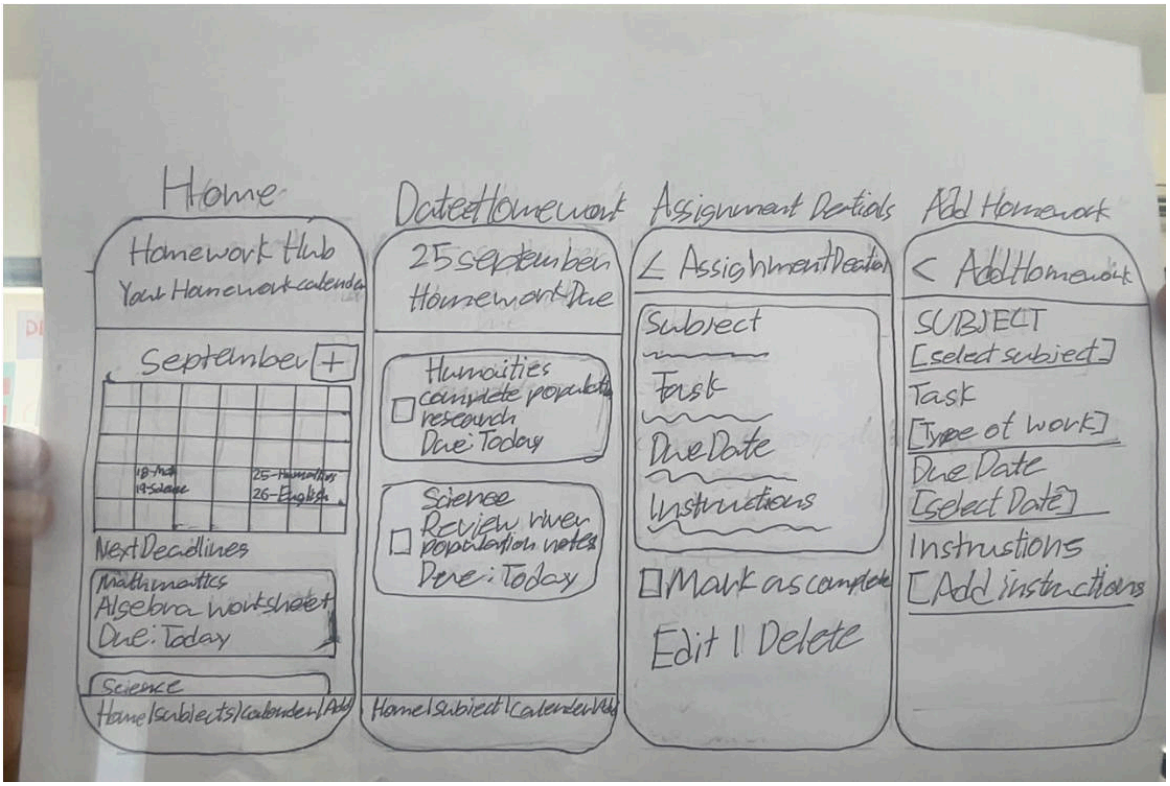

Annotate it: point to at least 2–3 features and say what each one does.

Justification Against Success Criteria :

The third one is titled Stash. The initial screen displays the individual tasks, without subjects. Then, you can add a new task by clicking "Add Task". This option allows you to select the subject and deadline, before saving and adding the task to the home screen. This wireframe fits the success criteria because it has a drop down box to select the subject, minimizing confusions, and it only requires 2-3 clicks to add a new task.

Idea 4

Annotate it: point to at least 2–3 features and say what each one does.

Justification Against Success Criteria :

This wireframe has the calendar on the home page. It contains small icons for the subject of the task, in the calendar. Once you click a certain task, it opens up that task's details, and the due date. There is also a side option to add a task at any time. The wireframe is simple, and shows the subject and deadline of the task on the home page itself, without being overcluttered.

3. Compare Your Ideas Against Your Specification

(check each idea against the specification you wrote in Strand i — this is not your final justification, that belongs in Strand iii, just a quick check that rules out anything that clearly will not work)

Idea	Meets these specification criteria	Feasible to build?	Best fits which user needs?
Idea 1	Yes	Yes	Yes
Idea 2	Yes	Yes	Yes
Idea 3	Partially	Yes	No
Idea 4	Partially	Yes	Partially

Criterion B

Strand (iii) — Present the Chosen Design and Outline the Reasons for its Selection

(Present = show and describe clearly, so it can be understood by someone else. Outline = give a brief account of the main points.)

1. Plan Your Design Selection

(quick notes only — these three parts are the same ones you'll write up as ONE paragraph in Part 2)

THE CHOSEN DESIGN

(name or describe which design idea you chose from your range of feasible ideas (Strand ii) — refer to it clearly, e.g. by name, number, or a short description.)

The home page shows each subject separately with a small icon. When a subject is selected, the tasks for that subject and their details are displayed directly.

REASONS FOR SELECTION

(why this design, and not your other ideas? What makes it the strongest option?)

I chose this design because it makes checking homework quick and simple, with only two clicks needed to view all the tasks for a subject. It clearly separates tasks by subject while keeping the layout simple and easy to understand.

LINK TO DESIGN SPECIFICATION

(how does this design meet the success criteria you set out in your design specification (Strand i)? Refer to specific criteria.)

This design meets my design specification by organising tasks by subject and making important information such as the task name, subject, deadline and priority easy to find. It also has a simple interface that allows users to access their homework without unnecessary steps or an overcrowded layout.

2. Write Your Selection Rationale

(now turn your notes into ONE connected paragraph — don't just answer the three parts separately. Refer to your design specification directly.)

Use these linking phrases to connect your ideas:

To present the design	*"The design I have chosen is..."*
To give reasons	*"I chose this design because..."*
To link to the spec	*"This meets my design specification by..."*
To compare	*"Compared to my other ideas, this design is stronger because..."*

DESIGN SELECTION — WORKED EXAMPLE

The Chosen Design + Reasons for Selection + Link to Design Specification

The design I have chosen is Wireframe Option 2 — a home screen with a single, large "Report Lost Item" button and a searchable list displayed directly underneath it. I chose this design because it puts the two most important actions, reporting and searching, front and centre, rather than hidden inside a menu like my other two ideas. This meets my design specification by satisfying the criteria that the app must let users report an item in under 3 taps, and that the search function must be visible without scrolling. Compared to my other ideas, this design is stronger because Option 1 buried the search bar inside a settings menu, and Option 3 required users to select a category before reporting, adding an extra step that my survey respondents said they would find annoying.

Presenting My Chosen Design

(The Chosen Design + Reasons for Selection + Link to Design Specification — write it as ONE paragraph below)

The design I have chosen is Wireframe 2, where the home page shows each subject separately with a small icon. When a subject is selected, all the tasks for that subject and it's details are displayed. I chose this design because it makes checking homework quick and simple, as only 2 clicks are required to view all the tasks in a specific subject. Compared to the other ideas, I think this design is the strongest because it clearly separates tasks by subject while keeping the layout simple and easy to understand. This meets my design specification by organising tasks by subject and making important information such as the task name, subject, deadline, and priority easy to find. It also meets my requirements for a simple interface that allows users to access their homework without unnecessary steps or an overcluttered layout.

3. Self-Check

Level	Term	What this looks like for Strand (iii) — exact IB wording
1–2	—	Not separately described at this level. The closest related content is Strand ii: "presents one design idea, which can be interpreted by others."
3–4	*Outlines*	"outlines the main reasons for choosing the design with reference to the design specification."
5–6	*Presents & Outlines*	"presents the chosen design and outlines the main reasons for its selection with reference to the design specification."

7–8	*Presents & Outlines*	"presents the chosen design and outlines the reasons for its selection with reference to the design specification."

Criterion B

Strand (iv) — Develop Accurate Planning Drawings/Diagrams and Outline Requirements for the Creation of the Chosen Solution

(Develop = produce in detail. Outline = give a brief account of the main points.)

1. Plan Your Planning Drawings

(quick notes only — these three parts guide the diagram and requirements list you'll produce in Part 2)

KEY SCREENS TO DRAW

(which screens/pages of your app need a wireframe? e.g. home screen, report screen, search results screen.)

Home screen that shows all the subjects separately along with their icons. The subject screen shows the tasks for the selected subject. Task details screen where it displays the task name, subject, deadline, and priority. And the add task screen, where it lets you add a new task.

NAVIGATION / USER FLOW

(how does a user move between these screens? Note the order and connections you'll show with arrows in your diagram.)

Home Screen goes to Select Subject, goes to Subject Screen, goes to Select Task, goes Task Details.

REQUIREMENTS NOTES

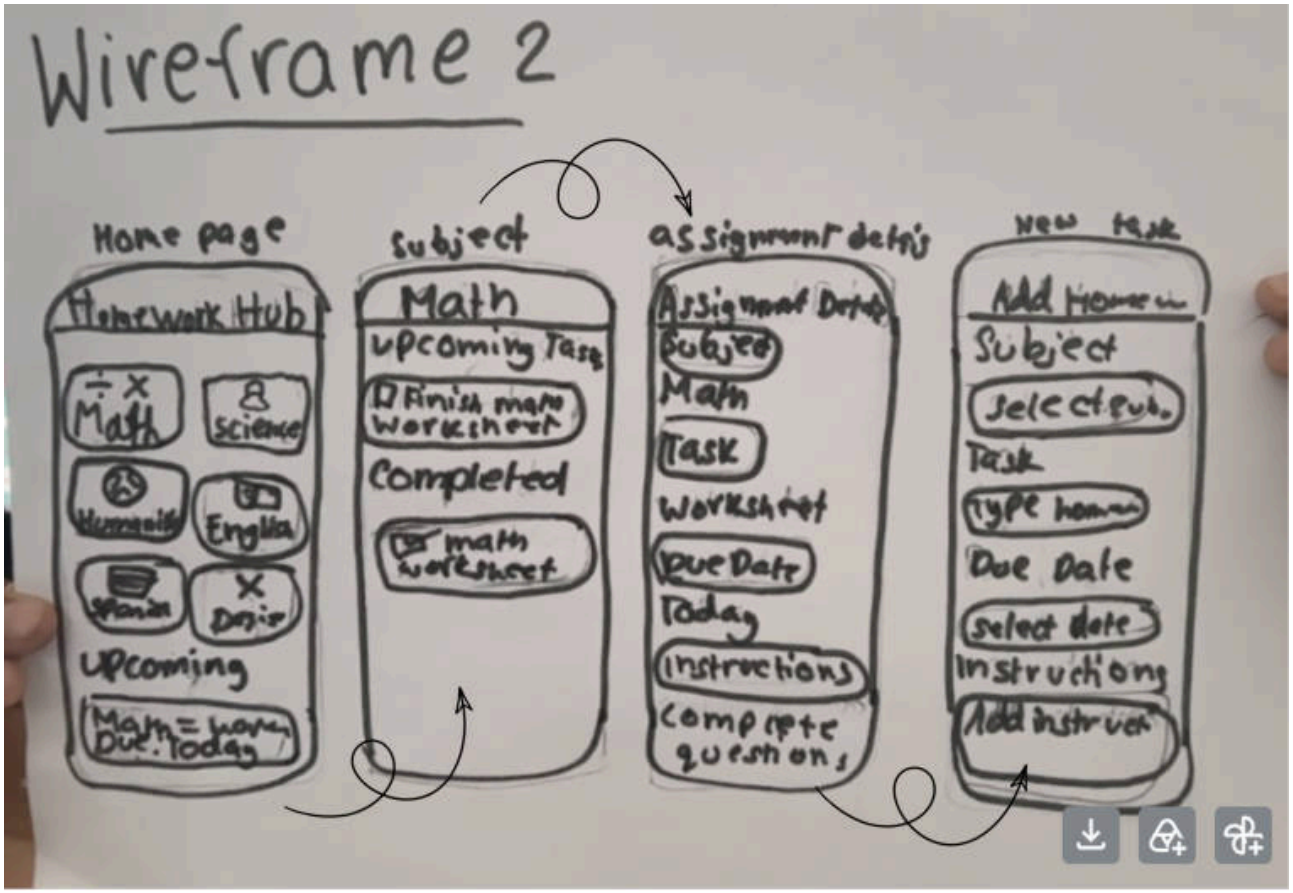

(quick list: what tools/software, features, content, and assets will you need to actually build this?)

- Figma as the digital design tool for creating and linking the wireframes.
- Calendar connection for setting homework reminders and notifications.
- Subject icons/assets to represent each MYP3 subject.
- Sample homework data to demonstrate the app functions.
- At least 4 screens: Home, Subject, Task Details, and Add Task.

3. Your Planning Drawings & Requirements

(sketch by hand and photograph/scan it in, or build digitally (Figma, paper prototype, etc.) — then insert or attach it below.)

INSERT OR ATTACH YOUR WIREFRAME(S) / SCREEN-FLOW DIAGRAM HERE

Requirements for Creation

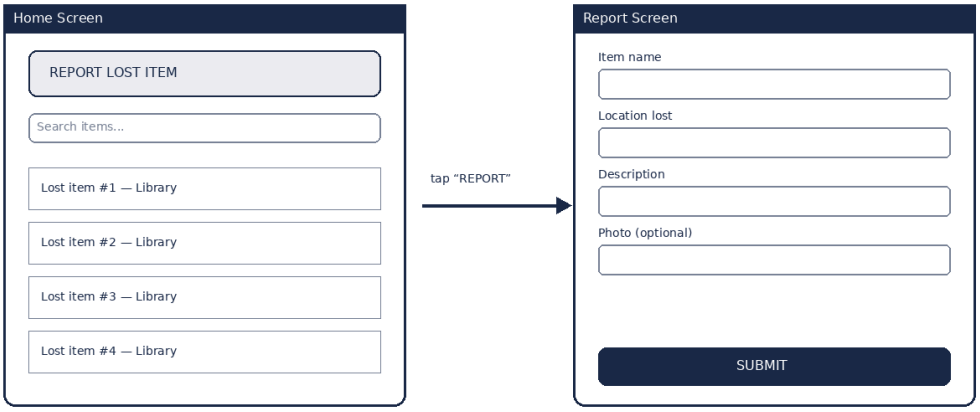

(list what you need to build your prototype: tools/software, screens, features, content, and assets)

To build this prototype I will need: Figma as a digital design tool for creating and linking the wireframes; a calendar connection for setting homework reminders and notifications; subject icons/assets to represent each MYP3 subject; and sample homework data to demonstrate the app functions. I will need at least 4 screens: Home, Subject, Task Details, and Add Task.

2. Worked Example

(a planning drawing shows the LAYOUT of each key screen and the FLOW between them — not the finished visual design (that comes later, in Criterion C).)

SCREEN-FLOW DIAGRAM — WORKED EXAMPLE

Two key screens, each labelled, with an arrow showing how a user moves between them.

Requirements for Creation — Worked Example

To build this prototype I will need: Figma (design tool) for creating and linking the wireframes; icon assets for the search and camera buttons; a simple colour palette (2–3 colours) consistent with our school app guidelines; and sample data (5–6 fake "lost item" entries) to populate the home screen list for the demo. I will need at least 4 screens: Home, Report, Search Results, and Item Detail.

4. Self-Check

Level	Term	What this looks like for Strand (iv) — exact IB wording
1–2	*Creates*	"creates incomplete planning drawings/diagrams."
3–4	*Creates / Lists*	"creates planning drawings/diagrams or lists requirements for the chosen solution."
5–6	*Develops / Lists*	"develops accurate planning drawings/diagrams and lists requirements for the creation of the chosen solution."
7–8	*Develops / Outlines*	"develops accurate planning drawings/diagrams and outlines requirements for the creation of the chosen solution."

(Wording is the exact IB MYP Design Guide text for Criterion B, Year 3. Note that at 3–4, EITHER drawings OR a requirements list is enough — by 5–6 you need both, and accurately.)

MYP3_Criterion_A_Strand_iii_FA_Template
